

### **Amendments to the Specification**

Please amend the paragraph beginning on page 4, line 3 in the specification as follows:

Regarding the feature link just briefly mentioned above, acquired source-image pixel data, in whatever color space that data initially exists, is reviewed initially to ~~call~~ cull out pixels which are either pure white or pure black. These pixels, where encountered, are directly sent to the printer for printing, without using any VED, and without performing any processing in the context of the palette/table.
